High School Student • Aspiring Developer • Open to Work

OBJECTIVE

A high school student passionate about software and game development, with strong foundations in multiple programming languages and web technologies. Actively making real games with Java and C++, freelancing for businesses building custom websites, and competing in hackathons. Currently exploring AI development and expanding into game dev with Lua, C#, and Unity. Looking for opportunities to contribute, learn, and grow.

LANGUAGES & TECHNOLOGIES

PROFICIENT **Java C++ Rust Python JavaScript TypeScript HTML/CSS SQL**

LEARNING **Lua C# GDScript AI/ML**

WEB/TOOLS **React Node.js Git Linux**

GAME DEVELOPMENT

Building real games using **Java** and **C++** — covering core game loops, physics, rendering pipelines, and engine-level fundamentals from scratch. Also learning Lua (Roblox Studio), C# (Unity), and GDScript (Godot) for higher-level scene structure, scripting game logic, and prototyping interactive experiences.

WEB DEVELOPMENT

Built full-stack and front-end projects with modern JavaScript frameworks (React), back-end scripting (Node.js, Python), and REST API integration. Comfortable with responsive design, CSS animations, and deploying to the web. Currently maintaining a personal portfolio site with a custom dark UI, music player, and real-time Discord integration.

AI DEVELOPMENT

Actively learning AI and machine learning fundamentals — exploring model APIs, prompt engineering, and integrating AI features into applications. Experimenting with tools like the OpenAI and Anthropic APIs to build AI-powered utilities and chatbots. Interested in the intersection of AI and software/game development.

PROJECTS & HIGHLIGHTS

Java & C++ Game Development

- Engineered complete games from scratch in Java and C++ — implementing custom game loops, collision detection, entity systems, and sprite rendering without engine abstractions
- Built a 2D Java game featuring physics simulation, tile-based maps, player state machines, and a basic level editor
- C++ projects focused on memory management, cache-friendly data layouts, and real-time performance optimization at the systems level

Hackathons

- Competed in multiple hackathons across different themes — shipped working products within 24-48 hour windows
- Built full-stack web apps, automation tools, and AI-assisted utilities under competition conditions
- Developed skills in rapid scoping, technical pitching, and delivering demos that actually run

Freelance Web Development

- Independently designed, developed, and deployed websites for multiple small businesses — sole point of contact from brief to launch
- Delivered custom React and vanilla JS front-ends matched to each client's brand, with responsive layouts and CMS integrations
- Handled contracts, revision cycles, and handoffs professionally — repeat clients and referrals from satisfied businesses

Discord Bot & Automation Tools

- Built multi-feature Discord bots in Python and JavaScript — moderation, custom commands, webhook pipelines, and live API data feeds
- Wrote automation scripts handling scheduled tasks, data scraping, and cross-platform integrations

Game Dev Prototypes — Roblox / Unity / Godot WIP

- Scripted Roblox experiences in Lua covering multiplayer logic, leaderboards, and custom UI systems
- Unity and Godot prototypes exploring scene management, 3D physics, and character controllers

EDUCATION

High School Student

Currently Enrolled

Self-studying computer science, game development, and software engineering alongside school curriculum.

Open to internships, part-time roles, and collaboration – reach out any time
